Section 5-1 First Derivatives & Graphs, continuing.

More terminology

Define "Partition Number"

Words:  $c$  is a partition number for the function  $g$ .

Meaning: Either  $g(c) = 0$  or  $g(c)$  DNE.

Use ~~see~~ this terminology to rewrite our definition of critical value

Definition of "Critical Value"

Words:  $c$  is a critical value for the function  $f$ .

Meaning: Both of the following are satisfied

- $f'(c) = 0$  or  $f'(c)$  DNE. That is,  $x=c$  is partition number for  $f'$ .

- $f(c)$  exists

## The First Derivative Test

A function  $f$  will have a local max or min at some  $x=c$  only when the following three conditions are all met.

- $f'(c)=0$  or  $f'(c)$  DNE

that is  
 $x=c$  is  
partition number  
for  $f'$

that is  
 $x=c$  is  
a critical value  
for  $f$

- $f(c)$  exists

- $f'$  changes sign at  $x=c$ .

## Final example involving graphical approach

### Exercise 5-1 #10

Given info:  $f$  is continuous for all  $x$ -values

The sign chart for  $f'$  is

Find  $x$ -coordinates of  $A$  maxes

Find  $x$ -coordinates of mins.

### Solution

- We see that  $f'(x) = 0$  or  $f'(x)$  DNE at  $x = a, b, c, d$

These are the partition numbers for  $f'$ .

- because  $f$  is known to be continuous, we know that  $f(x)$  exists at every  $x$ -value.

So we know that  $x = a, b, c, d$  are all critical values for  $f$ .
