## Key Idea 4.1.2 Newton's Method

Given: A function $f$ that is differentiable on an interval $I$ and that has a root in $I$. That is, it is known that there exists an $x=r$ somewhere in $I$ such that $f(r)=0$.
Goal: Find an approximate value for the root $r$, accurate to $d$ decimal places.
Step 1: Choose a value $x_{0}$ as an initial approximation of the root. (This is often done by looking at a graph.)
Step 2: Create successive approximations iteratively; given an approximation $x_{n}$, compute the next approximation $x_{n+1}$ by using the formula

$$
x_{n+1}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}
$$

Step 3: Stop the iterations when successive approximations do not differ in the first $d$ places after the decimal point.

Let $f(x)=x^{3}-x^{2}-1$. Observe that the graph of $f(x)$ obtained from Desmos shows an $x$ intercept somewhere between $x=1$ and $x=2$.

The goal is to use Newton's method to find a root of $f$. That is, the goal is to find an $x=r$ such that $f(r)=0$. You will do the first two iterations only, using the initial approximation $x_{0}=1$. That is, you will find $x_{1}$ and $x_{2}$.

For the function $f(x)=x^{3}-x^{2}-1$,
(a) Compute $f^{\prime}(x)$
(b) Fill out the following table. (Do the details below.)

| $n$ | $x_{n}$ | $f\left(x_{n}\right)$ | $f^{\prime}\left(x_{n}\right)$ | $x_{n+1}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}$ |
| :--- | :--- | :--- | :--- | :--- |
| 0 | $x_{0}=1$ |  |  | $x_{1}=$ |
| 1 | $x_{1}=$ |  |  | $x_{2}=$ |
| 2 | $x_{2}=$ |  |  |  |

(C) A zoomed-in graph of $f(x)$ is shown below. You'll illustrate your results on this graph.

- Put a point at $\left(x_{0}, 0\right)$
- Put a point at $\left(x_{0}, f\left(x_{0}\right)\right)$
- Put a point at $\left(x_{1}, 0\right)$.
- Draw the line that passes through $\left(x_{0}, f\left(x_{0}\right)\right)$ and $\left(x_{1}, 0\right)$. This line should appear to be tangent to the graph of $f(x)$ at the point $\left(x_{0}, f\left(x_{0}\right)\right)$.
- Put a point at $\left(x_{1}, f\left(x_{1}\right)\right)$
- Put a point at $\left(x_{2}, 0\right)$.
- Draw the line that passes through $\left(x_{1}, f\left(x_{1}\right)\right)$ and $\left(x_{2}, 0\right)$. This line should appear to be tangent to the graph of $f(x)$ at the point $\left(x_{1}, f\left(x_{1}\right)\right)$.
